

PIXELPALS – BACKEND ARCHITECTURE (MVP)

Description:

The PixelPals MVP uses a simple three-layer backend architecture. The frontend contains all HTML, CSS, and JavaScript files that the user interacts with.

When a form is submitted, XAMPP (Apache + PHP) handles the request and runs the backend script, such as login.php, registration.php, or routes.php. These PHP files process the POST data and can load product information from the data layer, which includes the backend developer CSV file and the simplified sample-data.php used instead of a database. This setup cleanly separates the frontend, server, backend logic, and data for the MVP.
